May play a role in sensing the chemical composition of the gastroincestinal contest. The activity of this receptor may stimulate alpha gustducin, mediate PLC-beta-2 activation and lead to the gating of TRPMS.
SUBCEMBLUAR LOCATION: Integral membrane protein.
TISSUS SPECIFICATION: Integral membrane protein.
of the tongue and palate epitholium and exclusively in gustducin.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          metabolically versatile Pseudomonas pulida KT2461.)

Environ, Microbiol, 4:799-808(2022)

-!- CATALYTIC ACITVITY: N(2)-8emialdoxyde + 2-qlutarate - N-acetyl-L-glutamate S-semialdoxyde + 2-qlutarate.

-!- COFACTOR: Pyridoxal phosphate (Hy similarity).

-!- PATHWAY Actinine blosynthesis: lourth step.

-!- MISCRILANEOUS: May also have succiny diaminopimelate aminotransferuse activity, thus carrying out the fourth step in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SIMILARITY: Belongs to class-III of pyridoxal phosphate-dependent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

-!- FUNCTION: THIS PROCEPTOR BINDS PLATELET-DERIVED GROWTH FACTOR AND HAS A TYROSINE-PROTEIN KINASE ACTIVITY. THIS RECEPTOR CAN BIND BITHER PDGF-A OR PDGF-B.
-!- CATALYTIC ACTIVITY: AIP - a protein tyrosine - ADF + protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claesson-Weish L., Eriksson A., Westermark B., Holdin C.H.:
"DNA cioning and expression of the humar A-type platelet-derived
growth factor (PDGF) receptor establishes structural similarity to
the B-type PDGF receptor."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    tyrosine phosphate.

This sequence was isolated using the primers given in AAQ6580-35. The ambilited irraments are used in the detection of hepatitis virus. This target DNA was isolated from serum of chronically infected NANBH patients who were CLOC antibody-positive and EVO RNA (NSS region) positive. Reverse transcription-POR and PCR wore performed on CDNA and the total human NANBH DNA was constructed from 23 closes.

```
The sequences given in AAGSE814-27 encode antigens of structural and non-structural regions of non A non B hepatitis virus (NAMBHV). These sequences were derived from the plasma of a NAMBH patient by recombinant DNA techniques. These fragments are useful for the diagnosis of NANBH patients and the detection of NANBHV carriers.
                                                          Nucieic acid fragment coding non-A non-B hepatitis virus antigen - useful in diagnosis of NANB patient and detection of virus

                                                                           Hepatitis C virus 44 and #6 genes were isolated (AAQ64068-69).
Both genes contain the core, ENV, NSI, NS2 and NS3 regions.
A core region fragment is given in AAQ64067.
                                                                                                                                                                                                                                                                                         Hepatitis C virus, HCV; antigen; detection: antibody; ds.

The invention relates to isolated polynucleotide (1) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques
                                                                                                                                                                                The sequences given in AAT30386-37 encode the 5'UTR/CORE/ENV/NS1/NS2/NS3 protein region derived from hepatitis C virus (HCV) isolates #4 and #6 respectively. The proteins encoded by these sequences particles encode amino acids 394-45 of the HCV NS1 antigen. These protein fragments may be used in the detection of antibodies against HCV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, chromosome mapping, gene mapping, gene therapy, forensic, food supplement, medical imaging, diagnostic, genetic disorder; ss.
Recombinant polypeptide comprising partial NSI region of hepatitis
non A non-B viral antigen - used in a method for detecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

to restore normal activity of (II) or to treat disease states involving quantitating a polypetide in tissue, as melecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II) and (II) and its binding partners are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polymented responsible for genetic disorders or defection of mutations responsible for genetic disorders or defect traits to assess biodiversity and to produce other types of data and produces sees biodiversity and to produce other types of data and produces themso hid and ordered and sequences. AAS64197-AAS94564 represent movel human bote: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from Wipo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to isolated polynucleotide (1) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oliqomers, and for chromosome

and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags of identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aborrant protein expression or biological activity. The polypeptide and polypurdleschide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. polypoptide (II) sequences. (I) is useful as speridisation probes, and gene mapping, and in recombinant production of (II). The polymorace chain reaction (PRP) princes, oliquents, and in recombinant production of (II). The polymoracelides are also used in disatiostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques for destreamoral activity of (II) at no treat, disease status incording quantitating a polypeptide in tissue, as molecular weight markers and us a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) are useful for treating discorders involving abeneating expression or biologica, setivity. The polypeptide and polynocleotide sequences have applications in
                                                                                                                                                                                                                          diagnostics, foremies, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess blodiversity and to produce other types of ata and products dependent on DNA and amino acid sequences. AAS94197-AAS94564 represent movel human diagnostic colding sequences of the invention.

Note: The sequence data for this pation, did not appear in the printed specification, but was obtained in electronic formst directly from WiPO

```
the present sequence comprises the nucleic actd sequence of the geneme of infectious hepatitis C virus (HCV) genotype 1b strain Br.24 (HCV) genotype 1b strain transfected into cells. HC-14 was obtained from cutte phase plasma of a chimpance experimentally infected with serum containing of a chimpance experimentally infected with serum containing to produce chimpance factions nucleic acid sequence can be used to produce chimpance genomes (see AAX2483) consisting of the open reading frames of infectious nucleic acid sequences of other centypes (inciding senotypes 1-6) and subtypes (suciding senotypes 1-6) and sequence and the introduction of mutations or deletious nucleic acid sequence or also be used to produce attenuated virus via passage in vitro or in the intertious nucleic acid sequence. Waccines comprising one or more polypeptides made from the infectious nucleic acid sequence or companies the virus. The nucleic acid sequences can also be used to inmunity adainst the virus. The nucleic acid sequences or their encoded proteases (e.g. NS3 protease) can additionally be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Chimeric virus; bovine viral diarrhoea virus; BVDV; hopatitis C virus;

                                                                                                                                                                                                                                                                                                                                                                       The specification describes a nucleic acid comprising a chameric virus genome. Specifically boying viral diarrhosa virus (BVDV) genome is which the (non-)structural region has been replaced by the (non-)structural region of a hepatitis C virus (BVDV) genome. The nucleic acids comprising the chimeric virus and the chimeric virus are useful for identifying cell lines capable of Supporting the replacation of These chimeric viruses, in the production of ECV-BVDV virions. For the development genotypes, in the production of ECV-BVDV virions, for the development of instituted or attenuated vaccines to prevent ECV-BVDV in a roummal, in studying the release proporties of ECV-BVDV virions, for the development in studying inhibitors of viral naryme activity which would be useful as antivital agents. Formulations or compositions comprising the assetute as antivital agents. Remarkations or compositions and symptoms of ECV-BVDV virions, which is used to construct chimeric public acids of the invention, which is used

The present invention relates to GB virus-B. The nucleic acid molecules of the invention are useful for indirectly studying the molecular properties of hepatitis C virus (HCV). The infectious nucleic acid sequence of the GB virus-B clone and the HCV/GBV-B chimeras may be used in the development of vaccines and therapeutics for HCV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a recombinant DNA construct of a plant (Arabidopsis thaliana) centromere. The constructs are useful for producing stably inherited michrosomes which can serve as vectors for the construction of transpenic plant and aminal cells expressing selected proteins such as hormones, enzymes, interieukins, clotting factors, cytokines, antibodies, and growth factors.
New infectious nucleic acids of the GB virus-B clone, useful for indirectly studying the molecular properties of hepatitis C virus (HCV) and in developing vaccines and therapeutics for HCV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Recombinant DNA construct comprising a plant centromere, useful for producing stably inherited michrosomes which can serve as vectors for the construction of transgenic plant and animal cells

The present invention relates to a recombinant DNA construct of a plant (Arabidopsis thaliana) centromere. The constructs are useful for producing stably inherited michrosomes which can serve as vectors for the construction of transquire plant and animal cells expressing selected proteins such as hormones, enzymes, interfeukins, clotting factors, cytokines, autibodies, and growth factors.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a recombinant DNA construct of a plant (Arabidopsis thaliana) centromere. The constructs are useful for producing stably inherited michrosomes which can serve as vectors in the construction of transgenic plant and animal cells expressing selected proteins such as hormones, enzymes, interfectains, clotting factors, cytokines, antibodies, and growth factors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Recombinant DNA construct comprising a plant centromere, useful for
producing stably inherited michrosomes which can serve as venters the
the construction of transgenic plant and animal cells.

The present invention relates to a recombinant DNA construct of a plant (Arabidopsis thaliana) centromere. The constructs are useful for producing stably inherited michrosomes which can serve as vectors for the construction of transposic plant and animal cells expressing selected proteins such as because, interleukins, clotting factors, cytokines, antibodies, and growth factors.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

/clone="ish-"Arabidopsis thaliana T-DNA from Arabidopsis thaliana plants (TI) which were transformed with the T-DNA from vector pAC161. The lines contain one or more T-DNA finsertions. The DNA fragment(s) resulting from the PCR wore directly sequenced to determine the genomic sequence flanking the insertion. Sequences displaying significant similarity to the A. thalalian nuclear genome sequence were
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SALK_082734.31.45.x Arabidopsis thaliana TDNA innear GSS 14-NOV-2002 Arabidopsis thaliana qenomic clone SALK_082734.31.45.x, genomic B2352875 B2352875.1 G1:24943737
indicates an insertion within the locus defined by clone F4MLY. The sequences are generated at the MPI for Plant Breeding Research in the context of the GABI-Kat project. GABI-Kat is part of the German Plant Genomics program designated 'GABI'. Information on line availability can be found at:

Submarted (NOV-1999) to the EMBL/GenBank/DDBJ databases.
-!- SIRUMIT: THE VIRION OF THIS VIRUS IS A NUCLECCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN B. THE NUCLECCAPSID IS A COMPLEX OF PROTEIN C AND MRNA (BY SIMILARITY).
